TITLE : Polyethylene Oxide Type Ointment Bases Containing Esters.

ORIG. PUB. : Ceskosl. Farmac., 1958, 7, No 5, 230-237

ABSTRACT : A possibility of employing "eriphore A" (a condensation product of oleic acid with 6 mols of ethylene oxide) for the preparation of emulsified ointment base of the "water in oil" type, was studied. After the determination of general constants of "eriphore A", an ointment base, containing 15% of "eriphore A", was prepared. Emulsifying agents and other auxiliary substances (to adjust consistency) were added. For this investigation two types of ointments were selected. The constants were established beforehand such as the stability in the presence of certain stabilizing

2095. EXPERIENCE WITH TETRA-ETHYL LEAD FOR CARS, FROM THE
HYGIENIC ASPECT - Naše dosavadní zkušenosti použitím ethylovaného
benzinu k pohonu motorových vozidel po stránce hygienické - Grünvald
A. and Barth A. Hyg. Epidemiol. Stanice, ÚNV, Praha - PRÁCOV.
LEK. 1958, 10/4 (346-348) Tables 1

The authors investigated garages for the concentration of lead in the atmosphere due to the use of ethylated petrol (tetra-ethyl lead). The lead concentrations found ranged from 0 to 1.32 mg./cu. m., on an average, the admissible concentration of lead, 0.05 mg./cu. m., was surpassed 5-10 times. The state of health was not influenced by the use of ethylated petrol. Simultaneously high values of carbon monoxide were found, which surpassed the maximum admissible concentration 3 to 13 times. Although so far no adverse effect on the state of health has been found, it will nevertheless be necessary to require perfect ventilation of garages, which

2095

will render it possible to keep the concentration of lead and carbon monoxide within permissible limits.

AUTHOR: Apostolescu, Nicolae, and Grünwald, Berthold, Engineers

TITLE: The Control of the Self Ignition Delay and of the Fuel Combustion in Compression-Ignition Engines on the Basis of the Kinetics of Chemical Reactions (Part I)

PERIODICAL: Metalurgia și construcția de mașini, 1959, Nr 7, pp 586-590 (Rumania)

ABSTRACT: The authors emphasize that the ideal mixture in diesel engines does not ensure an optimum of combustion. Despite the efforts made to obtain an ideal mixture, the diesel engines continue to burn the mixture far from ideally. Further progress must be sought by other means, such as that referring to the kinetics of burning. The control of combustion must solve two essential problems: reduction of the ignition delay and elimination of after-burning. In the light of research made in recent years, a new conception is de-
✓

Chemical Reactions (Part I)

veloping with respect to the combustion processes within the engine. The authors state that the classical conception had not paid sufficient attention to the mechanism of ignition by compression. Some authors, such as King affirm that a thermal decomposition of the hydrocarbons takes place, leading to the formation of carbon nuclei and skeletons. Socolic and other authors have recommended, the authors write, studying the complex process of delayed ignition in its various successive phases. The theory of Socolic is described. Based on recent research, the improvement of the combustion process is centered especially on the reduction of the ignition delay. The control of the burning process is analyzed. The main difficulty consists in the fact that no diesel fuels exist that respond to multiple contradictory requirements. Such fuels appear to be impossible to obtain.

Card 2/4

RUM/9-59-7-7/52

The Control of the Self Ignition Delay and of the Fuel Combustion
in Compression-Ignition Engines on the Basis of the Kinetics of
Chemical Reactions (Part I)

The solution must be sought in an adequate process of combustion. It is important to avoid the cracking of the fuel in the proper combustion period. The authors stress that Meurer's system consisting of a simple modification of the classical direct-injection engine constitutes important progress. In that system, the fuel jet is directed 95% to the wall of the combustion chamber which has a controlled temperature. The process is given an ample description. Graph 2 presents the variation of the pressure during combustion for three different angles of the fuel jet and for three different wall temperatures. Experiments made by Pishinger indicated that the increase of the jet angle with the wall tangent reduces the ignition delay and increases the ratio dp/dt . Similar effects have been observed by varying the wall

artificially roughened fuel-element can walls

SOURCE: Kernenergie, no. 5, 1964, 300-307

TOPIC TAGS: heat transfer coefficient, nuclear reactor, heat transmitter,
nuclear reactor heat transfer, Nusselt number

ABSTRACT: Heat-transfer and heat-flow measurements were made in a fuel-element can with artificially roughened water-cooled walls wound with wire of varying diameter and pitch under conditions of turbulent flow. The measurement data, of interest for nuclear reactors and conventional heat transmitters show that it is possible to obtain general data on the optimal roughness geometry at which the heat-transfer coefficient improves greatly with the least possible rise in the resistance coefficient. The heat-transfer measurement can be brought into an empirical relationship with the experimentally determined wall shearing stress

 CATEGORY : Inorganic Chemistry. Complex Compounds
 ABS. JOUR. : RZKhim., No. 1 1960, No.657
 AUTHOR : Grunze, H.
 INST. : Hungarian AS
 TITLE : Preparation and Properties of Dichlorophosphoric Acid
 ORIG. PUB. : Acta chim. Acad. scient. hung., 1959, 18, No 1-4, 303-312
 ABSTRACT : Data published earlier (RZKhim., No 13, 1959, No 45311) on the preparation and properties of HPO_2Cl_2 are cited. The impossibility of preparing pure HPO_2Cl_2 by hydrolysis of POCl_3 is explained by the fact that the substitution of Cl for OH in POCl_3 does not materially change the character of other bonds of P-Cl. Upon hydrolysis of $\text{P}_2\text{O}_3\text{Cl}_4$, the water adds to the bond

TITLE: Simultaneous urography and cholangiocholecystography

SOURCE: Suvremna meditsina, no. 5, 1965, 285-289

TOPIC TAGS: radiology, gastroenterology

Abstract [Authors' Russian and English summaries, modified]:
The article reports the results of simultaneous urography and cholangiocholecystography in 10 patients with unclear pain symptoms in the right subcostal region. The method is recommended in both emergency and routine practice. It is tolerated well and gives precise and quick results with very good contrast images. The following preparations were utilized: uromiro 60%, triuropan 62%, urographin 60-76% in combination with endostabil or biligrafin 50%, administered in series or simultaneously, mixed in the same syringe. Orig. art. has 3 figures.

USSR/ Electronics - Circuit breakers

Card 1/1 Pub. 133 - 7/23

Authors : Grusevich, S. I., Engineer and Laboratory Director of LONIIS (Leningrad
Branch of the Research Institute of the Ministry of Communications)

Title : Pulse circuit breaker

Periodical : Vest. svyazi 11, 14-15, Nov 1954

Abstract : An electromagnetic device known as a "pulse circuit breaker," used basically for automatic breaking of telephone circuits by means of relays, as a signal generator, and for testing the frequency values of pulse-signals, is described. The device can generate pulses between 5 and 10 cps. A circuit diagram illustrating the operation of the pulse circuit breaker is shown, and general instructions for connecting and disconnecting the device are given. The types of tubes used and the layout of transformers, resistances, capacitances and switches are indicated on the diagram. The circuit breaker can be operated from an A-C line of 110, 127, or 220 volts. Circuit diagram.

Abstract : The results of an experiment at the Benyavinskaya
Experimental Station (in the Belorussian SSR).
Corn grown on turf-podzolic sandy loam soil after
well fertilized potatoes yields, when the soil
was limed, a relatively high yield of greenstuff
and cobé (297 centners per ha.). To boost
the yield still further a local application of
small doses of organic mineral mixtures is enough.
